

NAVER LABS EUROPE

NAVER LABS Europe, France's biggest industrial AI research organisation.

We take the best of academic research and couple it with our strong industrial infrastructure to put algorithms in front of millions of users. These algorithms are part of our vision - a world of Ambient Intelligence where people intuitively interact with ubiquitous, helpful, personalised services they trust.

Our NLP group does research in machine translation, information extraction, document structure, analytics of user-generated content, recommendation, digital humanities, information-retrieval, question-answering, parsing and summarisation. We work very closely with the other research teams at LABS in computer vision, machine learning and optimisation, UX and design, edge computing and data process and modelling. Our people and their work are frequently recognised and awarded in international competitions and forums.

NAVER LABS Europe takes part in European Union and national R&D projects and collaborates with the NAVER start-up program in France 'Space Green' in Station F, the world's biggest start-up campus in Paris.

We are part of NAVER LABS, an ambient intelligence company of the Korean internet giant NAVER that operates the world's 5th largest search engine with over 75% market share in Korea. The company provides over 130 web and mobile services in content, entertainment and communication and tools and technology. NAVER was 9th on Forbes 2018 annual listing of the world's most innovative companies.

NAVER LABS Europe hires all year round.
